DETAILED ACTION

This is the First Office Action in response to the above identified patent application filed on July 25, 2003.

Priority

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-7 and 10-16 are rejected under 35 U.S.C. 102(b) as being anticipated by Great Britain Patent 544,458 (GB '458).

Referring to Figure 3, GB '458 discloses an electric motor device used in a vehicle window, the motor device comprising a housing, an electric motor (2) disposed within the housing, a pair of springs (4) disposed at each end of the motor, a limit switch (t) for sensing a position of a motor shaft (3), wherein the spring dampens a linear force acting on the motor.

4. Claims 1-7 and 10-16 are rejected under 35 U.S.C. 102(b) as being anticipated by Martinek (US Patent 2,978,621).

Martinek discloses an electric motor device used to convert a rotational force to a liner force, the motor device comprising a housing (1), an electric motor (2,5) disposed within the housing, a pair of springs (8) disposed at each end of the motor, a limit switch (18,19) for sensing a position of the linear output, wherein the spring dampens a linear force acting on the motor. Note, the switch inherently senses an axial movement of the motor and the motor drive shaft.

5. Claims 1-5, 7, and 10-16 are rejected under 35 U.S.C. 102(b) as being anticipated by Milbrandt et al. (US Patent 4,288,666).

Milbrandt et al. discloses an electric motor device used to convert a rotational force to a liner force, the motor device comprising a housing, an electric motor (10) disposed within the housing, a pair of springs (42,47), a limit switch (24) for sensing a position of a motor shaft (12), wherein the spring dampens a linear force acting on the motor.

Allowable Subject Matter

6. Claims 7-8 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Note the actuators having limit switches of Plotnikov et al. ('759), Zouzoulas ('799), and Flora ('825).
